

# M&M; African Kitchen & Bar Pre-Launch Access Checklist

What Ola needs to provide to unlock the June website, payment, ordering, POS, mailbox, and failover systems.

Prepared by Ni Biashara · Updated May 31, 2026 · Agreement signed; notarization scheduled June 1

Welcome aboard, Ola. We are glad to serve your business. The website is already live; this document lists the remaining access items needed to turn on the next operational layers safely after the signed agreement is notarized.

## Current status

### Live now: new public website

<https://mmafricankitchen.com/> is live and verified with public food, drinks, catering, entertainment, rewards, map, call, and order paths.

### Needs cutover: old/current domain

<https://m-mafricankitchen.com/> is still on the old WordPress host. We need DNS or WordPress access so old links redirect to the new site.

### Recommended: Google Workspace email

Use Google Workspace for @mmafricankitchen.com. Create one paid admin inbox, then use aliases/groups for info@, orders@, and events@ if cost matters.

### Prepared: ordering/payment bridge

Square, Uber Eats, TouchBistro, Grubhub, and the new POS can connect through one normalized order bridge once access is provided.

## Readiness verified on May 31

### Verified: website and layout

The live site is up, and the current site build passed desktop/mobile layout checks with the lower-page information boxes contained.

### Verified: domain status

The new domain is active on Netlify. The old domain is still separate on StormerHost and needs redirect access before customers with old links are moved cleanly.

### Pending: mailbox records

The new domain still needs final mailbox records. Google Workspace is recommended; once chosen, we will add MX, SPF, DKIM, and DMARC and test send/receive.

### Pending: failover mirror

Netlify is working now. A backup static host should be created and browser-checked before any DNS failover drill.

## The 4 access bundles we need

| Bundle             | What Ola provides                                                                                                                                        | What it unlocks                                                                                  | How we confirm it works                                                                                       |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| 1. Domain / DNS    | Login/admin access for m-mafricankitchen.com at StormerHost/cPanel/registrar, or WordPress access if DNS cannot move yet.                                | Old links automatically send customers to the new website.                                       | Open old URLs and verify HTTPS redirects to matching mmafricankitchen.com pages.                              |
| 2. Mailbox         | Choose Google Workspace or existing mail server. Provide admin access or DNS records for the chosen provider.                                            | Real business mailboxes: info@, orders@, events@.                                                | Send/receive tests; verify MX/SPF/DKIM/DMARC; update website mail links.                                      |
| 3. Square          | Square Developer/OAuth access or secure production token, plus Square production location ID.                                                            | Square payments, Orders records, payment links, checkout, and/or Terminal workflows.             | Run read-only Square location/API test; confirm correct restaurant location before customer payment exposure. |
| 4. Uber Eats + POS | Uber Eats Manager/developer access, store ID/API access if available, TouchBistro admin/partner access, Grubhub manager status, and new POS vendor name. | Automated Uber order capture; optional TouchBistro routing now; safe migration to new POS later. | Run Uber credential/webhook test; ingest test order; confirm one kitchen ticket and no duplicates.            |

## Recommended links for Ola

| Need                 | Links                                                                                                                                                               | What to do                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Google Workspace     | <a href="https://workspace.google.com">workspace.google.com</a><br><a href="https://admin.google.com">admin.google.com</a><br><a href="#">Google MX setup guide</a> | Set up the domain, create one admin inbox, then use aliases/groups for info@, orders@, events@.                               |
| Square               | <a href="#">Square Developer Dashboard</a><br><a href="#">Square Locations</a><br><a href="#">Square OAuth docs</a>                                                 | Invite us as developer or provide secure OAuth/token path plus production location ID.                                        |
| Uber Eats            | <a href="#">Uber Eats Manager</a><br><a href="#">Uber Developer</a><br><a href="#">Uber POS integration info</a>                                                    | Confirm whether API/POS integration is enabled. If not, approve fallback kitchen-ticket bridge while API access is requested. |
| TouchBistro          | <a href="#">TouchBistro Cloud</a><br><a href="#">TouchBistro integrations</a><br><a href="#">TouchBistro help center</a>                                            | Confirm admin access and whether direct order injection/API/partner integration is available.                                 |
| Grubhub              | <a href="#">Grubhub for Restaurants</a><br><a href="#">Grubhub POS integrations</a>                                                                                 | Confirm current Grubhub to TouchBistro integration remains active. Do not disturb it while adding Uber/Square.                |
| Old domain / hosting | <a href="#">StormerHost client area</a><br><a href="#">Old WordPress admin</a><br><a href="#">Netlify dashboard</a>                                                 | Give access or sit with us while we add redirects / DNS records.                                                              |

If a link opens the wrong account, switch to the account that owns M&M;'s restaurant/domain/vendor account.

## What each item unlocks

|                                                                                                                                                                                  |                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Old domain redirect</b><br><br>Customers with old links land on the new website instead of the old WordPress site. Need DNS/hosting/WordPress access.                         | <b>Professional email</b><br><br>info@, orders@, events@ routing, better trust, cleaner handoff for catering/events/orders. Need Google Workspace or chosen mail provider.             |
| <b>Square payment rail</b><br><br>Square checkout, payment links, order/payment records, and future customer payment flow. Need Square production app/token/OAuth + location ID. | <b>Uber Eats automation</b><br><br>Stops or reduces manual retyping of Uber orders into TouchBistro. Need Uber Manager/API/POS integration access or fallback ticket approval.         |
| <b>TouchBistro bridge</b><br><br>Bonus path: programmatic routing into current POS while Grubhub remains untouched. Need TouchBistro admin and API/partner confirmation.         | <b>New POS migration</b><br><br>Clean move away from TouchBistro without rebuilding Uber/Square/website integrations. Need new POS vendor, API access, menu export, location/store ID. |

## How we will test and prove each system

| System      | Test                                                                                           | Success means                                                                     |
|-------------|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Website     | Open homepage/menu/drinks/catering/entertainment on desktop and mobile; check browser console. | Pages render, CTAs work, no broken key assets, no console errors.                 |
| Old domain  | Open old domain and old internal paths.                                                        | They redirect to matching new website page over HTTPS.                            |
| Email       | Send and receive test emails to info@, orders@, events@.                                       | Messages arrive in the right inbox/group and replies send cleanly.                |
| Square      | Read-only API call to Square Locations, then controlled checkout test.                         | Correct restaurant location is returned; payments are not exposed until verified. |
| Uber Eats   | OAuth/webhook/API test, then controlled test order if provider access allows.                  | One order enters the bridge once with correct items, notes, and totals.           |
| TouchBistro | Confirm official integration mode, then test POS write or fallback ticket.                     | Kitchen receives exactly one accurate ticket; no duplicates/wrong orders.         |
| Grubhub     | Verify current Grubhub → POS routing remains active.                                           | Existing primary order channel keeps working during changes.                      |
| Failover    | Deploy same static site to backup host and browser-check it.                                   | If Netlify has a problem, a tested backup path exists.                            |

## Recommended process

- Sign/notarize agreement. No POS/payment/API access before the business agreement is in place.
- Collect the 4 access bundles: domain, mailbox, Square, Uber/POS.

- Redirect old website traffic first.
- Turn on business email and update site mail links after send/receive tests pass.
- Validate Square access read-only, then expose a controlled payment path.
- Validate Uber order access. If API access is blocked, use fallback kitchen-ticket bridge while partner access is pursued.
- Protect Grubhub/TouchBistro while adding Uber/Square around it.
- Prepare the new POS adapter after vendor selection and menu ID mapping.

## Action timeline

| Window         | Action items                                                                                                                                                       | Owner                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Today          | Review this checklist; confirm who controls old domain, Square, Uber Eats, TouchBistro, Grubhub, and email.                                                        | Ola + Ni Biashara              |
| Tomorrow       | Notarize agreement; collect access bundles; redirect old domain if access is available; start mailbox setup; run Square/Uber/POS readiness tests.                  | Ola + Ni Biashara              |
| This week      | Complete email cutover; verify old-domain redirects; configure Square first release path; classify Uber API vs fallback ticket route; protect Grubhub/TouchBistro. | Ni Biashara with Ola approvals |
| By end of June | Produce monthly proof report: website traffic/order path, Square readiness, Uber automation status, POS migration state, failover drill, and next recommendations. | Ni Biashara                    |

## Do not send secrets in text

Do not send passwords, card numbers, API keys, recovery codes, or private tokens through WhatsApp, SMS, or email. For live credentials, either log in during the work session, invite the correct account as a collaborator, or use a secure credential path.

## Quick checklist

- I can access or approve changes to m-mafricankitchen.com.
- I choose Google Workspace or another mail provider for @mmafricankitchen.com.
- I can access Square Developer / Square Dashboard and provide the production location ID.
- I can access Uber Eats Manager and confirm whether API/POS integration is available.
- I can access TouchBistro admin or confirm who manages the current POS.
- I can access Grubhub restaurant manager or confirm its current POS connection.
- I can name the new POS vendor and target migration timing.
- I can approve a backup static mirror for emergency hosting/failover testing.
